## Abstract of JP9234241

thermally deformable orthosis is made from a poly-lactic acid resin with a glass-transition point of 40 to 80 PROBLEM TO BE SOLVED: To provide an inexpensive orthosis which can easily be thermal- deformed from a standard shape to a user-specific shape and reduces the disposal problem after use. SOLUTION: A deg.C. The resin is formed in a standard orthosis shape, the orthosis is thermal-deformed at a temperature higher than the glass-transition point and lower than the molding temperature (for example, bathed in hot water), then the orthosis is cooled to a temperature lower than the glass-transition point with keeping the above, a standard shape orthosis is thermal-deformed and a user-specific shaped orthosis 1 is obtained deformed shape (for example, naturally cooled in the air) and fixed its deformed shape. As mentioned
